

# DendroMap: Visual Exploration of Large-Scale Image Datasets for Machine Learning with Treemaps

Group 32

胡丞佑 張紀睿 張以廉

# Outline

- Introduction
- Design Goal
- DendroMap Construction & Interaction
- Use Cases
- User Study
- Limitation and Future Work

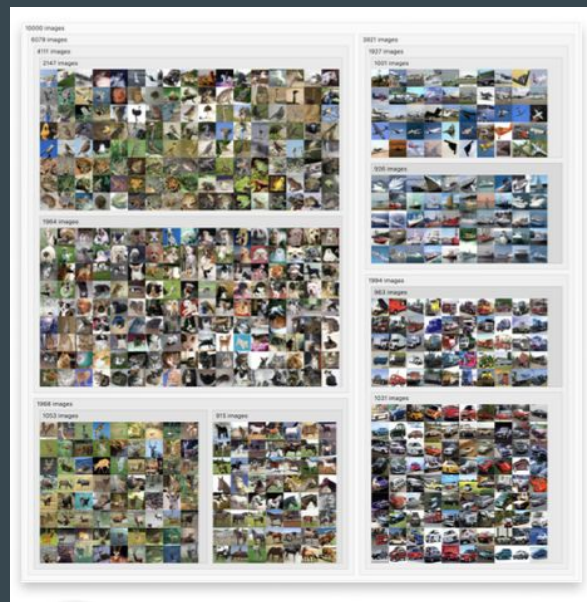

# Introduction

- **importance of understanding datasets**
  - we can build models efficiently and appropriately
- **But images doesn't like those tabular data**
  - lack many attributes

combine t-SNE & Grid

DendroMap

# Design goal

- Overview of data Distributions
- Exploring at Multiple Levels of Abstraction
- Instance-Level Exploration
- Subgroup-level Analysis for ML

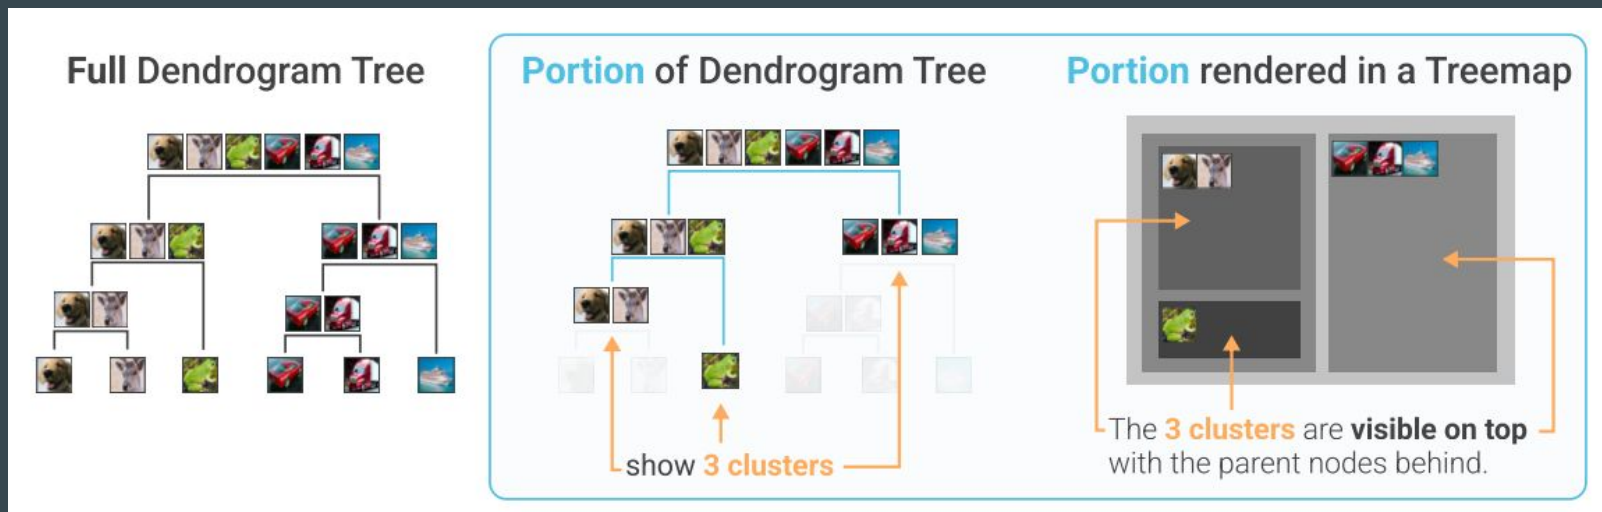

# DendroMap

## Construction & Interactions

# DendroMap Construction

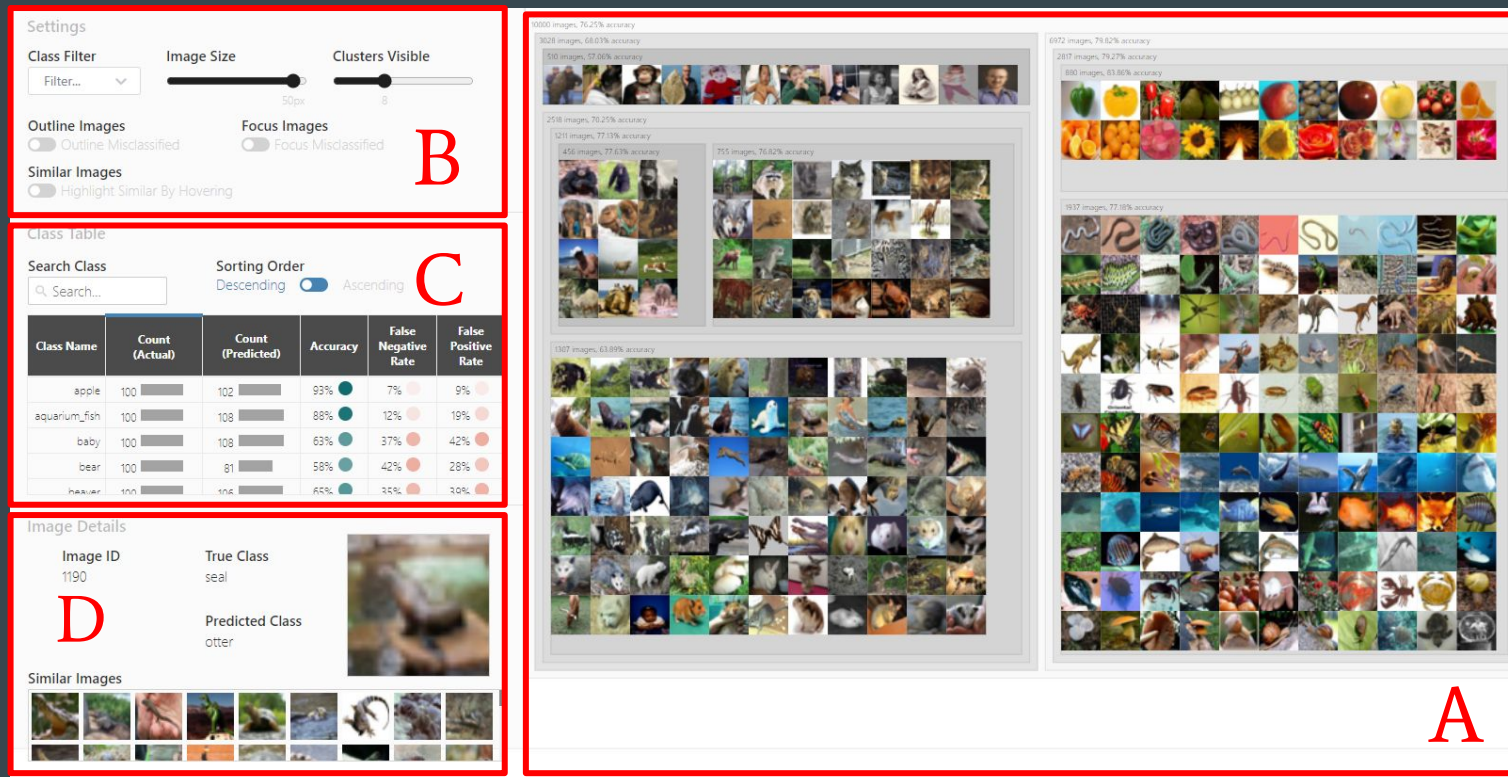

Input: High-dimensional representation of images

Output: Dendrogram Tree, which will be displayed by DendroMap

<https://academic.oup.com/jnl/article/26/4/354/377434?login=true>

# Visualize System Overview

A. Main Figure

B. Settings

C. Class Table

D. Image Detail

# DendroMap Demo

### Settings

**Class Filter**  
Filter...

**Image Size**  
50px

**Clusters Visible**  
8

**Outline Images**  
☒ Outline Misclassified ☐ Focus Misclassified

**Focus Images**  
☐ Focus Misclassified

**Similar Images**  
☒ Highlight Similar By Hovering

### Class Table

**Search Class**  
Search...

**Sorting Order**  
Descending ☒ Ascending

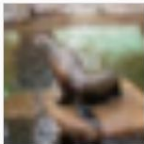

Class Name	Count (Actual)	Count (Predicted)	Accuracy	False Negative Rate	False Positive Rate
apple	100	102	93%	7%	9%
aquarium_fish	100	108	88%	12%	19%
baby	100	108	63%	37%	42%
bear	100	81	58%	42%	28%
beaver	100	106	65%	34%	30%

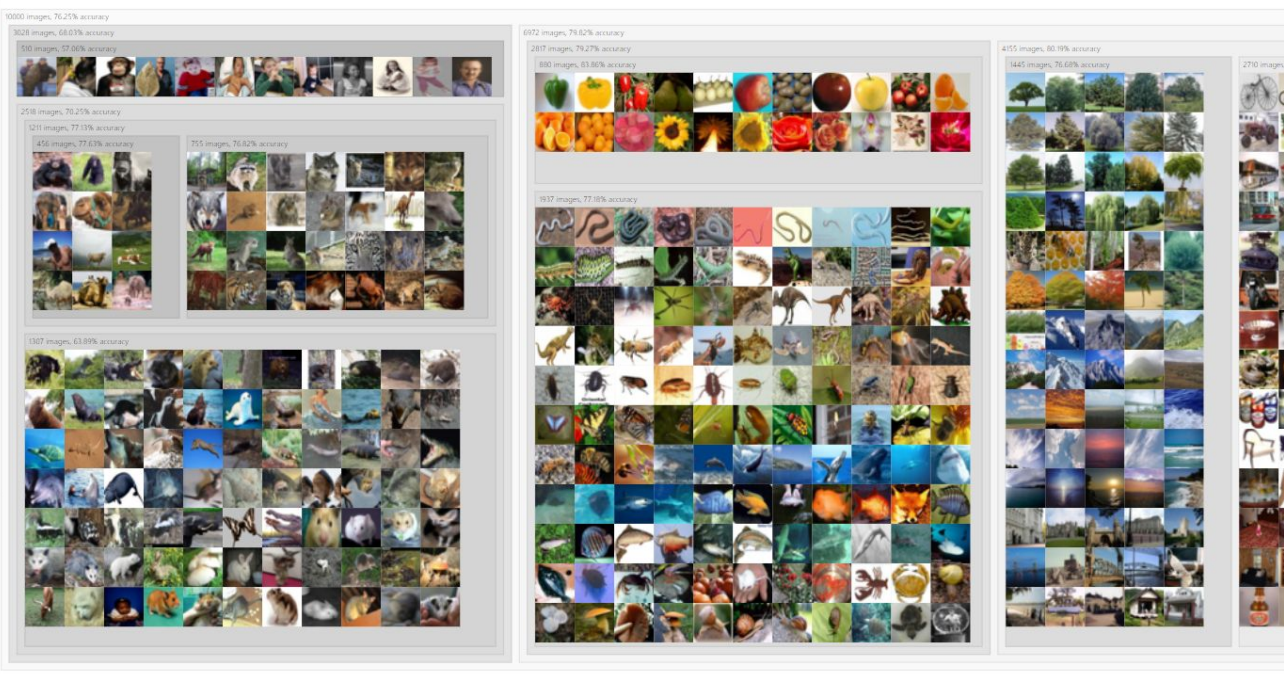

### Image Details

**Image ID**  
1190

**True Class**  
seal

**Predicted Class**  
otter

10000 images, 76.25% accuracy  
3028 images, 68.03% accuracy  
510 images, 57.06% accuracy  
2518 images, 70.25% accuracy  
1211 images, 77.13% accuracy  
456 images, 77.63% accuracy  
755 images, 76.82% accuracy  
1107 images, 63.89% accuracy  
6072 images, 78.82% accuracy  
2017 images, 79.27% accuracy  
880 images, 63.86% accuracy  
4155 images, 80.19% accuracy  
1445 images, 76.68% accuracy  
2710 images

# Use Cases

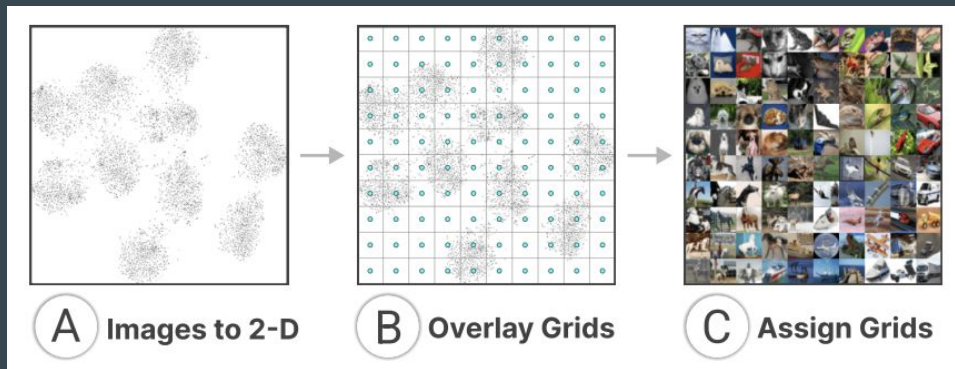

# Use Cases

- Examining Bias in Datasets
  - Using zooming function
  - Observe potential bias in the dataset
- Identifying Underperforming Subgroups
  - Zoom into underperforming clusters
  - Use class table to observe majority class predicted and the performance of it
- Analyzing Classification Errors
  - Use “outline misclassified” and “focus misclassified” to focus on misclassified images
  - Use image detail window to see the label of the image

# User Study

# Baseline: t-SNE-Grid

- gridified version of t-SNE

# Study Setup

- **Participants**
  - 20 students who have taken at least one AI or ML course.
- **Protocol**
  - evaluated both DendroMap and t-SNE-Grid.
  - two visualizations and two datasets
  - filled out a post-questionnaire form

#	Phase 1		Phase 2	
	Visualization	Dataset	Visualization	Dataset
1	t-SNE-Grid	Artifact	DendroMap	Organism
2	DendroMap	Artifact	t-SNE-Grid	Organism
3	t-SNE-Grid	Organism	DendroMap	Artifact
4	DendroMap	Organism	t-SNE-Grid	Artifact

Table 1. Four conditions for counterbalancing the orders of two interfaces in our within-subject design

# Study Setup

- **Dataset and Models.**
  - CIFAR-10 and CIFAR-100
  - ResNet50 model
- **Tasks**

#	Phase 1		Phase 2	
	Visualization	Dataset	Visualization	Dataset
1	t-SNE-Grid	Artifact	DendroMap	Organism
2	DendroMap	Artifact	t-SNE-Grid	Organism
3	t-SNE-Grid	Organism	DendroMap	Artifact
4	DendroMap	Organism	t-SNE-Grid	Artifact

Table 1. Four conditions for counterbalancing the orders of two interfaces in our within-subject design

#	Task Description
1.	<b>Categorizing images</b> into groups across 40 classes
2.	<b>Categorizing images</b> into groups for a single class
3.	<b>Identifying groups</b> of images with high classification accuracy within a single class
4.	Estimating the image count <b>distribution</b> over multiple groups within a single class
5.	<b>Searching</b> for an image with a given text description
6.	<b>Searching</b> for an image with a given visual description
7.	Searching for an <b>anomalous</b> image with an incorrect class label

Table 2. Seven tasks designed to evaluate several grouping and searching tasks used in ML analysis

# Results - Evaluation of task completion time

- No significant difference between t-SNE-Grid and DendroMap

# Results - Evaluation of task responses

- **Task 1**
  - “Collectively exhaustive” property more with DendroMap than t-SNE-Grid.
- **Task 2, 3**
  - No significant difference.
- **Task 4**
  - Closer to the actual distribution when using DendroMap
- **Task 5, 6**
  - All the participants searched the correct images successfully.
- **Task 7**
  - DendroMap is more helpful in finding potential anomalies in image datasets.

#	Task Description
1.	<b>Categorizing images</b> into groups across 40 classes
2.	<b>Categorizing images</b> into groups for a single class
3.	<b>Identifying groups</b> of images with high classification accuracy within a single class
4.	Estimating the image count <b>distribution</b> over multiple groups within a single class
5.	<b>Searching</b> for an image with a given text description
6.	<b>Searching</b> for an image with a given visual description
7.	Searching for an <b>anomalous</b> image with an incorrect class label

Table 2. Seven tasks designed to evaluate several grouping and searching tasks used in ML analysis

# Results - Evaluation of post-questionnaires

Question	t-SNE-Grid	DendroMap
Easy to learn how to use	<b>6.45</b>	6.30
Easy to use	6.00	6.00
Helpful for overview	5.95	<b>6.45</b> <sup>◦</sup>
Helpful for detailed analysis	5.15	<b>6.05</b> <sup>*</sup>
Helpful for finding specific images	5.10	<b>5.75</b> <sup>◦</sup>
Helpful to identify image categories	5.70	<b>6.20</b> <sup>◦</sup>
Helpful to discover new insights	5.25	<b>6.00</b> <sup>◦</sup>
Confident when using the tool	5.85	<b>6.05</b>
Enjoyed using the tool	6.10	<b>6.40</b>
Would like to use again	5.80	<b>6.65</b> <sup>*</sup>

Table 3. Participants' average ratings for the two visualizations. DendroMap outscored t-SNE-Grid in 8 out of 10 questions. Bold indicates higher average ratings. \* and ◦ indicate 95% and 90% statistical significance in one-sided Wilcoxon signed-rank tests, respectively.

# Limitation and Future Work

# Limitation and Future Work

- Computational scalability of clustering
- Comparison with other tree construction methods.
- Interactive refinement of tree structures.
- Using interpretable attributes for tree construction
- Formalizing interaction operations.

**Thanks for your listening**
